

The Trader's X-Ray

Mastering the Continuation Entry Model

THE ENGINE OF MARKET STRUCTURE: THE ICC LOOP

Diagnostic Structural Framework // Technical Analysis

INDICATION (Step 1)

Always creates a new high or new low.

CORRECTION (Step 2)

Retracement to gather liquidity.

CONTINUATION (Step 3)

The trend resumes.
The Entry Trigger.

// SYSTEM_RULE: Step 1 and Step 2 must be confirmed before Step 3 can exist. The Continuation is the only entry.

THE BREAKOUT TRAP VS. THE CONTINUATION EDGE

Diagnostic Structural Framework // Technical Analysis

The Breakout Trader

Enters aggressively on the first break of support/resistance.

Targeted by "**Liquidity Grabs**" during the Correction phase.

Frequently faked out. Costs sellers to get into the market just to wipe them out.

The Continuation Trader

Waits patiently for the "second time around."

Enters only after **structural confirmation** (ICC).

High probability entries with protected stop-losses.

Key Insight: Waiting for the continuation above/below that level will save you.

DIAGNOSING THE TREND: SYMPTOMS VS. REALITY

Diagnostic Structural Framework // Technical Analysis

The 1-Hour Chart (Macro)

Shows the symptom. Identifies the overall trend and boundaries, but lacks entry precision.

The 5-Minute Chart (Micro)

Shows the root cause. Tracks the micro-structure of the correction to pinpoint the exact moment of reversal.

If somebody has a headache, a doctor does an X-Ray. You have to go deeper inside the 1-hour trend to see what's really going on.

THE MULTI-TIMEFRAME MATRIX

Diagnostic Structural Framework // Technical Analysis

CATEGORY	1-HOUR (THE BLUEPRINT)	5/15-MINUTE (THE X-RAY)
THE DOMAIN	→ Broad trend & major boundaries	→ Micro-trend & structural shifts
PRIMARY FUNCTION	→ Find the Indication (New Low/High)	→ Track the Correction & trigger the Continuation
TARGET ACTION	→ Set Take-Profit (TP) zones	→ Set exact Entry point and Stop-Loss (SL)
LOOKBACK WINDOW	→ 3 to 4 days is all you need. Don't go 30 years back.	→ Current session

MACRO BLUEPRINT: FINDING THE INDICATION

Diagnostic Structural Framework // Technical Analysis

Indications will always create a new high or a new low. If it's not either one, it's not an indication.

THE CORRECTION PHASE & THE LIQUIDITY GRAB

Diagnostic Structural Framework // Technical Analysis

The Correction is designed to grab liquidity. It pushes past immediate boundaries to trigger the stop-losses of breakout traders, wiping them out before the real move begins.

Zooming In: Deploying the 5-Minute X-Ray

Once the 1-Hour Indication is set, we scale down to the 5-minute timeframe to track the internal structure of the Correction.

TRACKING THE MICRO-TREND

As long as price is continuing to break highs and respect supports, the correction is still active. Do not trade yet.

Structural Exhaustion: The Equal High Warning

Price fails to break the previous high. Buyers are losing strength. Equal Highs tell you price isn't trying to go higher, but it hasn't broken support yet. Wait.

The Micro Indication: Trend Collapse

Golden Rule:

Price should not break its structure unless it is reversing.

A Lower Low followed by a Lower High confirms the sellers have taken control.

The Strike: The Continuation Entry

The Complete Trade Lifecycle

The Continuation Checklist

- ☒ **1H Indication Confirmed:** Did the macro timeframe create a new high or new low?
- ☒ **Correction Tracked:** Did you zoom into the 5M/15M to track the retracement?
- ☒ **Liquidity Swept:** Did price fakeout breakout traders before stalling?
- ☒ **Structural Shift Confirmed:** Did the 5M chart print Equal Highs or a Lower High/Lower Low?
- ☒ **Continuation Triggered:** Did price cross back your primary level for the second time?

**"The first two steps save you from fakeouts.
The third step gets you paid."**
