

DAY TRADING CRASH COURSE #3

Mastering Market Structure

The Indication & Correction Framework

The Core Framework: I.C.C.

TECHNICAL SPECIFICATION // MODEL FRAMEWORK 1.0

The Language of Price

Uptrend

Built entirely of Higher Highs (HH) and Higher Lows (HL).

Downtrend

Built entirely of Lower Lows (LL) and Lower Highs (LH).

The Baseline Rule: Highs and lows dictate the trend—not psychological numbers or Fibonacci levels.

Phase 1: The Indication

- Occurs when price breaks a previous structural high or low.
- Reveals exact market intent (e.g., a push from 69k targeting 73k).
- Sets the undeniable baseline for future entries.

Phase 2: The Correction

- A strategic pullback forming a Higher Low (in an uptrend).
- The market is regaining its composure, not reversing.
- Provides the necessary secondary confirmation to prevent fake-outs.

Phase 3: The Continuation

- Price executes its intended structural path.
- Targets the previous indication high.
- Establishes a new peak, resetting the market structure cycle.

The Entry Strategy

THE BLUEPRINT

The previous Indication level becomes your new Entry level. Wait strictly for price to correct back to this line.

THE TRIGGER

If price maintains composure and holds above the line, execute the trade.

Multi-Timeframe Alignment

MACRO LENS: 4-HOUR CHART

Identify the overarching **Indication** and major structural breaks.

MICRO LENS: 1-HOUR CHART

Time the precise **Correction** and ensure immediate structure aligns.

Rule: Both timeframes must tell the exact same structural story before entry.

The Infinite Loop

Trends are continuous chains of ICC.

A successful Continuation becomes the next Indication.

The strategy is built to rinse and repeat.

The Golden Rule of ICC

Never trade the initial break.
Always wait for the Correction.

The second push is what confirms momentum
and protects you from the fake-out.
