

THE CHART MARKUP BLUEPRINT

A TOP-DOWN PLAYBOOK FOR CATCHING HIGH-VOLUME TRENDS

SYS_INIT // MACRO-TO-MICRO WORKFLOW

THE 3-PHASE EXECUTION FUNNEL

HIGH TIME FRAME STRUCTURE IS THE ULTIMATE ARBITER

Never map your overall structure on a 5-minute chart. The 1H and 4H time frames determine the true trend and filter out intraday market noise.

THE ARBITERS

[1-HOUR] [4-HOUR] [DAILY]

The Structure. Holds significantly stronger than LTF. Dictates the overall trend.

THE TRIGGERS

[5-MINUTE] [15-MINUTE]

The Execution. Used solely for precise entry timing once HTF direction is confirmed.

Step 1: Isolate Current Price and Identify the Nearest Boundaries

Whenever you open the 1-Hour chart, locate the current price first. From there, immediately identify the closest high and the closest low. These are your immediate operating boundaries.

The Anatomy of Market Structure

A trend is simply a sequence of swing highs and swing lows.
We only trade in the direction of the confirmed 1H sequence.

Drawing the Yellow Boxes: Where Momentum Originates

Mark your structural
highs and lows with
distinct zones.

Support is not just a
line; it is the exact
origin point where
severe bullish momentum
previously entered the
market. This is where
buyers are currently
sitting.

The Battle of Breakouts

The market is a battle between buyers and sellers sitting at your marked levels. When a level breaks, it confirms one side has entirely lost control.

The Catalyst: Trading with Session Volume

Mapping levels is useless without the volume to break them. The London session injects the heavy momentum required to initiate true directional moves and validate structural breakouts.

The Indication and Correction Cycle

Volume sessions provide the initial Indication of the daily trend.
Out-of-session price action is almost always a slow Correction.
Wait for the correction to end before trading the continuation.

Filtering the Noise and Avoiding Liquidity Traps

Intraday price action during volume open can be extremely volatile. Strict adherence to 1-Hour boundaries combined with established session volume naturally filters out fakeouts and liquidity grabs.

Scaling Down: Aligning the Micro with the Macro

Once the 1H chart indicates a trend and the market enters a volume session, scale down to the 5m or 15m time frame. Do not execute until the micro-structure shifts to match the macro-trend.

The Entry Trigger: Spotting the Micro-Shift

Wait for the exact moment the 5m or 15m structure shifts. For a short entry, wait for the LTF to fail to make a Higher High, print a Lower High, and break micro-support.

The Execution Matrix: Breakout vs. Retest

The Aggressive Entry (Scalper)

Enter immediately upon the break of LTF structure.
Higher risk, captures the entire move.

The Safe Entry (Confirmation)

Wait for price to break, pull back, and retest the newly formed resistance. Lower risk, proves sellers are defending.

Risk & Reward: Targeting Momentum Origins

Place your Stop Loss safely above the structural high that was just broken.

Set your Take Profit at the origin of the previous momentum—the next major swing low on the 1-Hour chart.

Active Management: Trailing the 5-Minute Structure

Once in profit, use the 5m chart to manage the trade.
As long as price continues making Lower Highs, hold the position. If the 5m structure breaks and prints a Higher High, close the trade immediately.

The Complete Markup Masterclass

1. Map the 1H boundaries and confirm the macro trend.
2. Wait for the London Session to inject volume.
3. Zoom into the 15m chart and execute on the micro-shift.

EXECUTION: Confirm macro structure, await volume injection, and enter on the precise micro-structure break with predefined risk parameters.
