

MECHANICAL TIMEFRAME CORRELATION: THE FRACTAL PLAYBOOK

A top-down system for filtering fake-outs, syncing macro trends with micro entries, and trading the ICC Cycle on the NASDAQ and US30.

The Absolute Rule of Correlation

If you trade off the 1-hour chart, every timeframe beneath it must agree before execution. Taking a 15-minute entry against a 1-hour correction is gambling. A valid trade only exists when the macro hypothesis and the micro execution sync perfectly.

The Trap

Isolated timeframes generate conflicting signals

The Edge

Timeframe
Analysis

Correlated timeframes confirm true momentum

The Timeframe Hierarchy Matrix

Timeframe Tier	Primary Function	Active Phase	Key Action Required
4H / Daily (The Macro)	Direction & Trend	Indication	Mark ultimate swing highs and lows.
1H (The Mid)	Clarity & Structure	Correction	Identify buying/selling pressure zones and wait for structural shifts.
15m / 5m (The Micro)	Precision Entry	Continuation	Execute upon micro-structure failure (e.g., lower-high break).

Price is Fractal: The Macro contains the Micro

A 15-minute downtrend is often just the pullback of a 4-hour bull run.
We use the 15m to catch the exact second the 4H resumes.

The Engine of Market Structure: The ICC Cycle

The Liquidity Rule: Target Your Counterparty

You don't sell an iPhone to someone who already owns one. You sell it to a buyer. In the markets, never take a buy position into existing buyers—take it to the sellers.

If you are **BUYING...**

Target the Sellers. This is where buy orders are absorbed.

If you are **SELLING...**

Target the Buyers. This is where sell orders are absorbed.

Step 1: Establish the Macro Hypothesis (4H)

The workflow starts wide. Identify the current Indication on the 4-hour chart. Has price broken a major resistance to create a new high? If yes, the macro hypothesis is Bullish.

Step 2: Monitor the Correction (1H)

Once the 4H indication is set, drop to the 1-hour chart. You will see price selling off, creating resistance levels. We are waiting for the exact moment the 1-hour chart shifts back to bullish alignment.

The Trigger Zone: Scaling to the Micro

As the 1-hour correction hits a support zone and stalls, we drop to the 15-minute chart. We need to see the micro bearish structure completely fail.

Micro-structure is fracturing.
Prepare for Continuation.

Step 3: The Micro Shift (15m Lower High Failure)

On the 15-minute chart, monitor the lower highs. As long as price respects lower highs, the correction is intact. The second price breaks above a lower high, sellers are exhausted. The trend has shifted.

Recognizing Micro-Structure Failure

The Buy Setup: Lower High Failure

Invalidates 15m Sellers -> Aligns
with 4H Bullish Trend.

The Sell Setup: Higher Low Failure

Invalidates 15m Buyers -> Aligns
with 4H Bearish Trend.

The Mechanical Execution Sequence

Total Alignment: The Lock & Key

A valid trade is not a single event. It is the exact second that three independent timeframe cycles sync up. When the macro, mid, and micro all point in the same direction, probability peaks.

Scaling Out: Managing the Target

You entered on the 15-minute timeframe to limit risk, but your targets belong to the macro timeframe. Target the origin of the correction—the 4H swing high where the sellers are trapped.

The Volume Clock: Strike Zones vs. Fake Volume

Perfect alignment fails without volume. Out-of-session movements are often fake volume traps. Execute only during periods of institutional liquidity.

The Daily Operating Manual

[01]

Macro Check

Mark 4H and 1H structural highs/lows. Determine the Indication.

[02]

Wait for Correction

Let price pull back. Do not force trades in the middle of a 1H correction.

[03]

Zoom to Micro

When 1H hits support/resistance, drop to 15m. Map the micro lower-highs/higher-lows.

[04]

Execute on Failure

Wait for the micro-structure to break, confirming alignment with the Macro. Execute.

The background features a faint, light gray grid. Overlaid on this grid is a large, circular graphic composed of several concentric rings. These rings contain interlocking gear-like shapes, creating a complex, mechanical pattern that resembles a stylized clock face or a technical diagram. The overall aesthetic is clean and technical.

Trade the System, Not the Noise.

**Timeframe correlation removes emotion from the chart.
By waiting for the 4H, 1H, and 15m to perfectly align, you stop
guessing tops and bottoms and start executing on confirmed
confirmed momentum. Wait for the alignment. Trade the
ICC cycle. Target the counterparty.**
